

CONSEAL PII REDACTION CONFIRMATION TOOL

SUMITHRA S- CB.SC.U4CSE23749

Problem 3: Sam is moving fast and trusts the tool a little too much, so mistakes slip through. I built this to break his autopilot but keep manual corrections fast.

FEATURES

- Colour-coded redactions: high positive score (>75) is hard black, medium (50-75) is dark blue, and low (<50) is yellow. User added redactions are black. Removals get a translucent red border.
- On hover, solid black redactions turn translucent so you can see what's underneath.
- Clicking a redacted text removes the redaction and selecting text allows you to redact it and categorize as well.
- Sidebar on the right containing lists of risks, all redaction and all removals as an easy to review collection. It orders everything from highest risk to lowest.
- Inconsistency checking: if you redact "John" somewhere but miss it somewhere else, it gets highlighted to maintain consistency.
- Proximity scanning: if you manually redact a word, it highlights the word before and after and asks whether to redact those too.
- Versioning of text so you can have multiple versions with different redactions if needed.
- Actual hashed/redacted export in txt and pdf formats (using jspdf).

Handling Export Friction

- Missed positives and redacted negatives happen because Sam doesn't stop to look. Before exporting, if you choose not to redact something with a 75-100 confidence score, it asks "are you sure?".
- It shows a list of those high confidence texts with tick and cross boxes next to them to easily redact.
- If any high-risk text is intentionally left unredacted, you have to type "confirm" before exporting. This forces him to actually stop and look.

What I Chose Not to Build

- No global "approve all" button. Sam would just click it and skip the review entirely.
- No right-click context menus. Keeping actions on-hover and in the sidebar respects his speed, while the export friction stops him only when he's about to make a real mistake.
- No actual cloud LLM backend, only a mock version with mock data to focus more on the features I wanted to implement since this problem is very frontend and UI/UX heavy.
